**DETAILED ACTION*****Double Patenting***

1. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the “right to exclude” granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

2. Claims 1, 3-7, 15-22, 24, 25, 37 and 38 rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-4, 6, 9 and 16-23 of U.S. Patent No. 7,015,544. Although the conflicting claims are not identical, they are not patentably distinct from each other because they both disclose a transistor having a gate located over a channel region recessed into a semiconductor substrate, comprising: a source/drain including a lightly doped region located adjacent said channel region and a heavily doped region located adjacent to but not surrounded by said lightly doped region within said semiconductor substrate; an oppositely doped well located under and within said channel region; a doped region, located between said heavily doped region of said source/drain and said oppositely doped well, having a doping concentration profile less than a doping concentration profile of said heavily doped

region of said source/drain; another source/drain including lightly doped region located adjacent said channel region and a heavily doped region located adjacent said lightly doped region; and another doped region, located between said heavily doped region of said-another source/drain and said oppositely doped well, having a doping concentration profile less than doping concentration profile of said heavily doped region of said another source/drain; and an oppositely doped buried layer under said doped region and said another doped region.
